

Master Data Management

- For centralised master data management -

MDM therefore not only offers the centralised administration of master data, but also ensures that the data is precisely defined for internal applications as well as external communication, easy to integrate and effectively accessible.

The challenges

Many cash-in-transit companies are familiar with the challenge of customer master data being entered manually at various decentralised sites, and being collated over time: mistakes and deviations in customer numbers, company names and contact partners are inevitable. If data exchange is necessary, different sets are not compatible.

- ✓ Master data management (customers, divisions, branches and ATM) with suitable location allocation
- ✓ Management of settings per customer/division/branch/ATM: address, contacts, account connection, configuration, supply, parameters, reports, exports, ICC branches

The solution

Cloud-based master data management (MDM) optimises master data processes across different locations, ensuring a consistent data pool by centralising master data management. Without additional programme installation, the solution uses a central web-based application to manage all customer master data, paying-in and paying-out parameters and file exports. Access data for the customer branches in the ICC app can also be managed with MDM.

The benefits

- ✓ All customer master data and additional settings are managed and synchronised using one single application.
- ✓ Despite data distribution across multiple locations, data is always up-to-date and correct thanks to MDM.
- ✓ Technical connections and the supply of different sites with the latest master data takes place completely automatically in the background. Data is exchanged between the MDM system and the cash centre via the ICC platform using encryption.

The functions

- ✓ Central management of banks, debtors, non-cash funds, materials, ATM types, export and import formats and reports
